

UNCLE ALBERT'S WATER ALARM™

Wireless Water Alarm Dialer

The Uncle Albert Wireless Water Alarm Dialer uses a water sensor combined with a powerful 12V wireless transmitter.

The wireless transmitter constantly monitors the water sensor. When an alarm condition occurs, the transmitter will send a wireless signal up to 300 feet back to the alarm dialer which will initiate its dial out sequence!

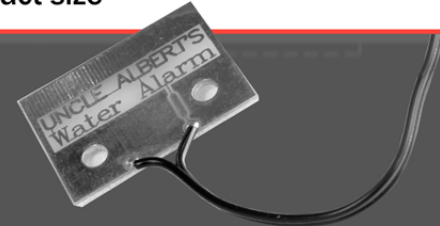

The dialer continues to dial out until a contact acknowledges the water alarm. The UA Water Alarm Dialer also allows you to record three alarm messages.

You can have as many water sensors operating with the alarm system as you like and have them divided into three zones with their own individual alarm messages. When the alarm dials the emergency contacts you can have the alarm message tell your contact the room or appliance which has caused the water alarm!

UAT-1000 UNIVERSAL TRANSMITTER

- Addressable codes
- Compact size

UAD-300 AUTO DIALER RECEIVER

- Three programmable channels
- Each channel can have multiple transmitters
- Three customizable messages
- Stores up to six telephone numbers, in priority order
